

## Modeling ADSS Cables in PLS-CADD and PLS-CADD/Lite

Modeling ADSS cables in PLS-CADD and PLS-CADD/LITE is quite simple. This Technical Note discusses how to do so using data sheets commonly supplied by Alcoa Fujicura Ltd. (AFL), or data supplied by other ADSS manufacturers.

The typical ADSS Specification will include the Cable Diameter, Cable Weight, Maximum Cable Rated Load (MRCL), Approximate Cable Breaking Strength, Coefficient of Linear Expansion, and the Initial, Final, and 10 Year Cable Modulus. These quantities are sufficient to model the ADSS in PLS-CADD and PLS-CADD/LITE. The section of the specification will typically be formatted as shown in Figure 1:

Section 3.0 Completed Cable Details		
Physical / Mechanical / Electrical Characteristic	Metric	English
Approximate Cable Diameter	15.5 mm	0.61 in
Approximate Cable Weight	179 kg/km	0.12 lbs/ft
Maximum Rated Cable Load (MRCL)	1,285 kg/km	2,833 lbs
Approximate Cable Breaking Strength	2,378 kg/km	5,243 lbs
Minimum Bending Radius	Static	155 mm
	Dynamic	312 mm
Coefficient of Linear Expansion	1.61E-05 1/°C	8.96E-06 1/°F
Cable Modulus	Initial	6.07 kN/mm <sup>2</sup>
	Final	6.55 kN/mm <sup>2</sup>
	10 Year	5.06 kN/mm <sup>2</sup>

Figure 1 - Typical ADSS Specification from Manufacturer

To input this data in PLS-CADD and/or PLS-CADD/Lite, click on **Sections/Cable Files/Create New Cable File...** where you can input the following general information as well as the mechanical information on the **Physical** tab of the **Cable Data** dialog:

- Description = User Defined
- Manufacturer = User Defined (AFL, Corning Inc., Prysmian, ZTT, etc.)
- Cable Type = ADSS
- Cable Model = Non-linear
- Unit Weight = Approximate Cable Weight (lbs/ft)
- Cross section area =  $\frac{\pi \times \text{Cable Diameter}^2}{4}$
- Outside diameter = Cable Diameter
- Ultimate tension = Maximum Rated Cable Load (MRCL)<sup>5</sup>

<sup>5</sup> **Note:** Some manufacturers may allow using the higher Cable Breaking Strength, or RBS, for the Ultimate Tension value. When doing so, please note that the MRCL is usually less than the NESC recommended 60% tension limitation in Rule 261H.1.a, and your **Criteria/Cable Tensions** and **Criteria/Automatic Sagging** information should be modified accordingly. Also note that you may have other design conditions such as a Heavy Ice that may result in a higher tension than the MRCL, so these cases must also be limited in the Criteria tables to ensure that they are not exceeded. It is simpler and safer to just use the MRCL for the Ultimate Tension value to ensure that it is never exceeded.

- Number of independent wires = Usually 1
- Temperature at which strand data below obtained = 70°F (≈20°C) will usually work
- Final modulus of elasticity for the Outer Strands = Final Cable Modulus\*\*
- Thermal expansion coefficient = Coefficient of Linear Expansion\*\*
- Stress-strain coefficient a1 = Initial Cable Modulus
- Creep coefficient c1 = 10 Year Cable Modulus

No other cable data values are required. Note that you may need to convert the units for the modulus and thermal expansion values. Once input, the data for our example specification would be as shown in Figure 2:

The screenshot shows the 'Cable Data' dialog box with the following fields and values:

- File: \\NAS\shared\Tech Notes\Modeling ADSS Cables in PLS-CADD and PLS-CADD Lite\adss\_technote example.wir
- Description: AFL ADSS Part Number DNA-5334 ADSS Cable
- Manufacturer: Alcoa
- Cable Type: ADSS
- Physical tab selected.
- Strands: (empty)
- Diameter (in): (empty)
- Cable Model:
  - Nonlinear cable model (separate polynomials for initial and creep behavior for inner and outer materials)
  - Linear elastic with permanent stretch due to creep proportional to creep weather case tension
  - Linear elastic with permanent stretch due to creep specified as a user-input temperature increase
- Cross section area (in<sup>2</sup>): 0.292247
- Outside diameter (in): 0.61
- Unit weight (lbs/ft): 0.12
- Ultimate tension (lbs): 2833
- Default Tension (lbs): (empty)
- Number of independent wires (1 unless messenger supporting other wires with a spacer): 1
- Temperature at which strand data below obtained (deg F): 70
- Final modulus of elasticity (psi/100): 9496
- Thermal expansion coeff. (/100 deg): 0.000896
- Polynomial coefficients (all strains in %, stresses in psi):
 

a0	a1	a2	a3	a4
	8805			
- Creep coefficients:
 

c0	c1	c2	c3	c4
	7338			

Figure 2 - Cable Data Dialog Box in PLS-CADD

\*\* **Note 2:** Pay attention to units. In the example provided 949.6 kpsi = 949,600 psi = 9496 psi/100. Always ensure that you're inputting the correct values based on the units required in the Cable Data Dialog.

\*\* **Note 3:** Pay attention to units. In the example provided  $8.96 \times 10^{-6} / 1 \text{ deg F} = 0.000896 / 100 \text{ deg F}$ . Always ensure that you're inputting the correct values based on the units required in the Cable Data Dialog.

All information required to use the non-linear cable model is typically provided in a manufacturer's cable specification sheet. You could use a linear elastic model instead, but you'll need to make assumptions about the cable creep behavior. This is discussed in greater detail in our [Linear Elastic Cable Model technical note](#) and Section 9.11 and Appendix G.2 and G.3 of the PLS-CADD User's Manual.

Data on the **Electrical** tab for electrical and thermal rating properties are not required, unless you will be using one of the thermal rating functions of PLS-CADD with the ADSS - *this is highly unlikely*.

Once you've created your cable file, you can generate a graph of the stress-strain behavior with the **Graph Cable Properties** button from the dialogue box shown above. The graph for ADSS will look like Figure 3.

That is all that is required to create a PLS-CADD ADSS cable file. This ADSS cable file can now be used on your PLS-CADD projects to not only develop stringing charts, but also to check clearances and loadings of the ADSS under various climatic conditions. In addition, you can ensure that your ADSS will not interfere with the significantly greater sag changes that your transmission and distribution conductors will experience with temperature changes and thereby prevent any clashing, or worse, wrapping, that you might experience in the field. With the communications industry "standard" of sagging in ADSS at 1% of the span length, these types of problems do occur quite frequently and should be carefully checked with a proper analysis.

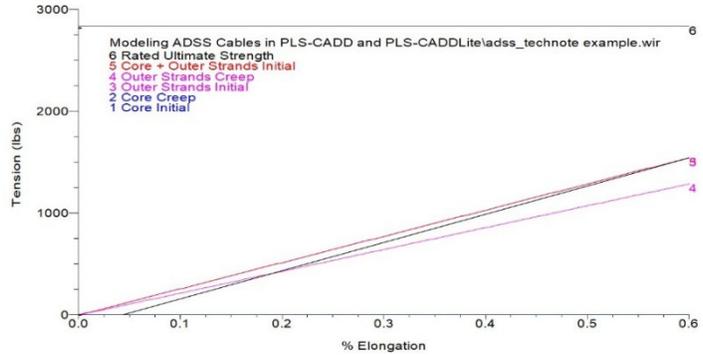

Figure 3 - Cable Stress Strain Graph

As you can see from the above, the necessary data is standard properties for any ADSS, so there isn't any reason why your ADSS supplier cannot help you. If your manufacturer has any questions, please have them contact us. We will assist them in getting all of their cable data into a PLS-CADD ready format and, if desirable, we can even add them to our [online library](#) for all of their customers to download and use.
