

# Frame Structures - PyraMAX & SAPS

P. Joel Bryant, P.E.

June 15, 2022

# PYRAMAX

TOWER

PLS-POLE

# PyraMAX Design Overview

---

- Design based on ASCE Standard 48
- Designed with Valmont IMPAX
- Valmont standard connection types
- Form of a tower; Components of a Pole
  - “Battering” the legs allows efficient conversion of transverse to axial load

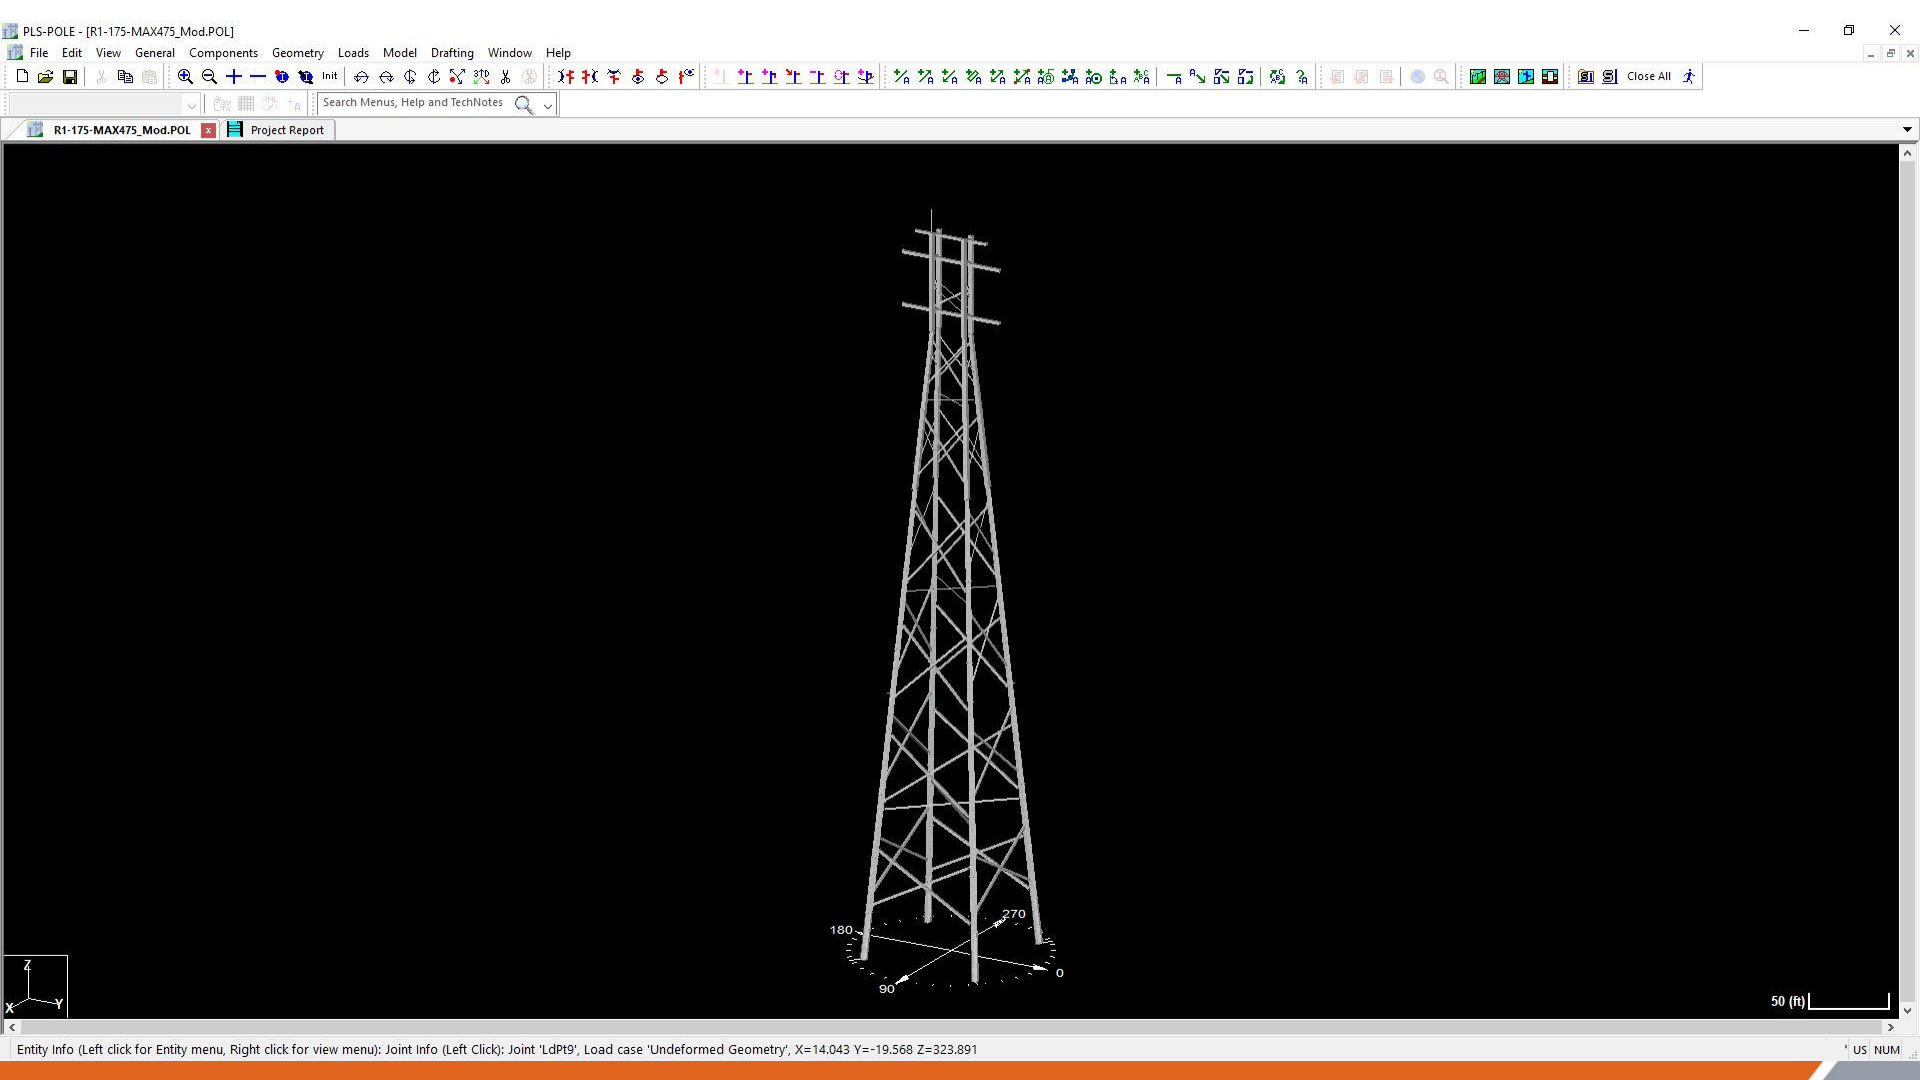

# PyraMax Crossing Structure

---

- 230 kV, Double Circuit
- 475 ft. (+15 ft. Lightning Mast)
- 410 ft. to Bend Line (Transition from battered legs to vertical)
- Base Spread – 80 ft. x 80 ft.
- “Legs” at the base – 55 inch diameter

R1-175-MAX475.POL Project Report

# Modeling

---

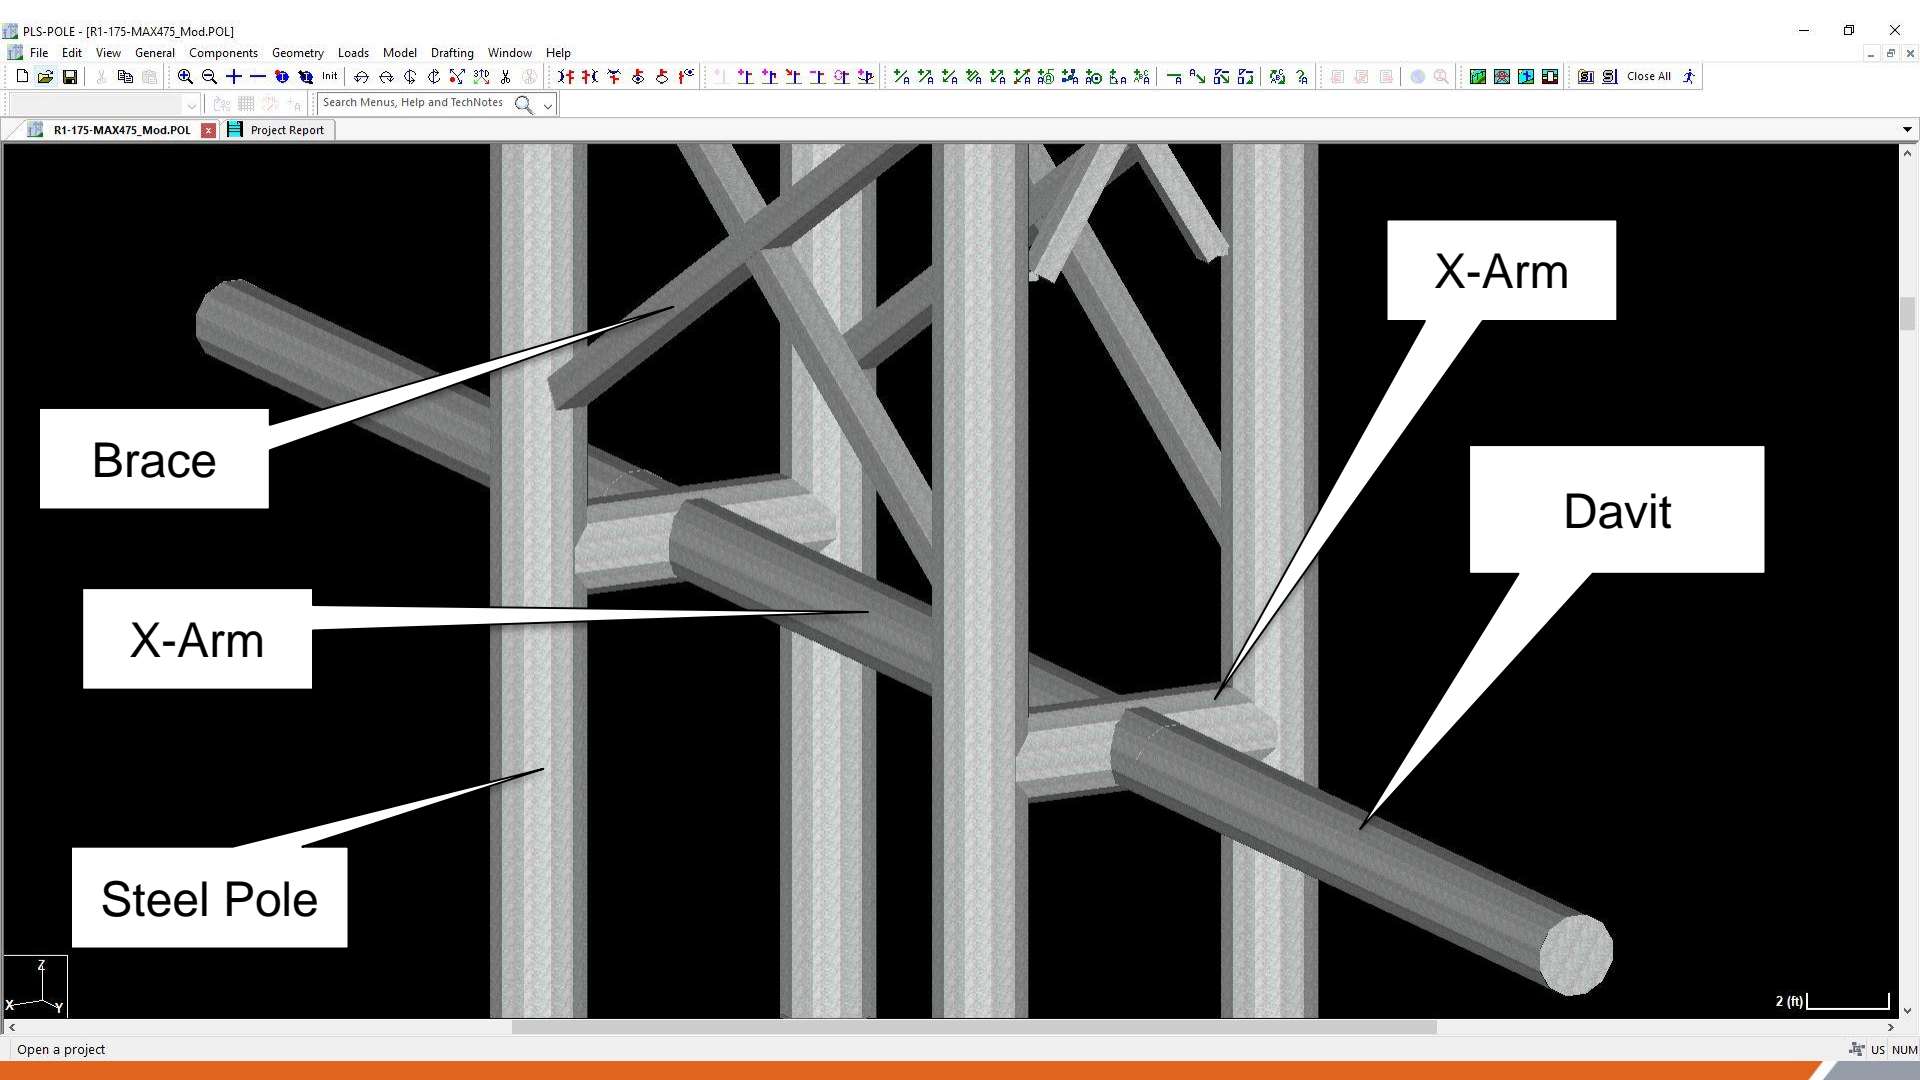

- Uses Steel Poles, Braces, Tubular X-Arm, Davit Arms, and Vangs
- 49 Primary Joints
  - Reduced to 13 with Symmetry
- Steel Pole Connectivity Defined by Tip and Base Joints
  - 44 Steel Poles

# Modeling (cont.)

---

- 124 Vangs
- 62 Brace Members
- 9 Tubular X-Arms
- 4 Davit Arms

# Analysis Results Comparison – PLS-POLE to IMPAX

---

- Foundation Reactions
  - Controlling Case at each leg = < 6.2% diff.
  - One Case, all legs = < 5.6% diff.
- Member Forces – One Leg, One Load Case
  - Average Percent Diff, Axial Force = <10%
  - Moments and Shears more variable
- Differences due to:
  - Different point location along member
    - Closest points used in comparison
  - Connections included in IMPAX

50 (ft)

# What Could Be Better?

---

- Symmetry, Symmetry, Symmetry
  - 44 “Poles” → 11
  - 124 Vangs → 31
  - 62 Brace Members → 17
  - 9 Tubular X-Arms → 6
  - 4 Davit Arms → 2
- Secondary Joints

# What if you wanted to do something like this?

# How to model?

- Could model separately: Arms in TOWER, transfer reactions as forces to PLS-POLE
  - Does not accurately account for pole flexibility
- Model Entire Structure:
  - TOWER?
    - No
  - PLS-POLE?
    - Not enough Brace (truss) elements
      - » 200; No symmetry
    - No connection checks
    - Code requirements?
- Or

# SAPS

## Structural Analysis of Power and communication Systems.

# Accurate TOWER model of arms; including loads

Accurate PLS-POLE  
model; including  
attachment locations

Quick Help for Entity Info: Press  
J to switch to Joint Info mode  
M to switch to Member Info mode  
P to switch to Property Info mode  
G to switch to Group Info mode

F1  
Menu

- ✓ Maximize selected dialogs
- ✓ Enable relative path remapping and the Project Repair Wizard
- Override INI file location...
- Enable right click customize interface...
- Debugging Stuff >
- Disable Multithreaded Analysis
- Enable Nonlinear Debug Mode
- Print All Load Cases
- Round Point Loads...
- Generate Model Statistics Report...
- Write a SAPS v1 input file
- Joint Commands >
- Reset Drafting Sheets to Default Content
- Recover Joint and Member Symmetry...
- Redefine sections by elements rather than elevations with joints...
- Override member section colors with automatically chosen material colors
- Stabilize 2-part insulators...

- Custom / Under Development >

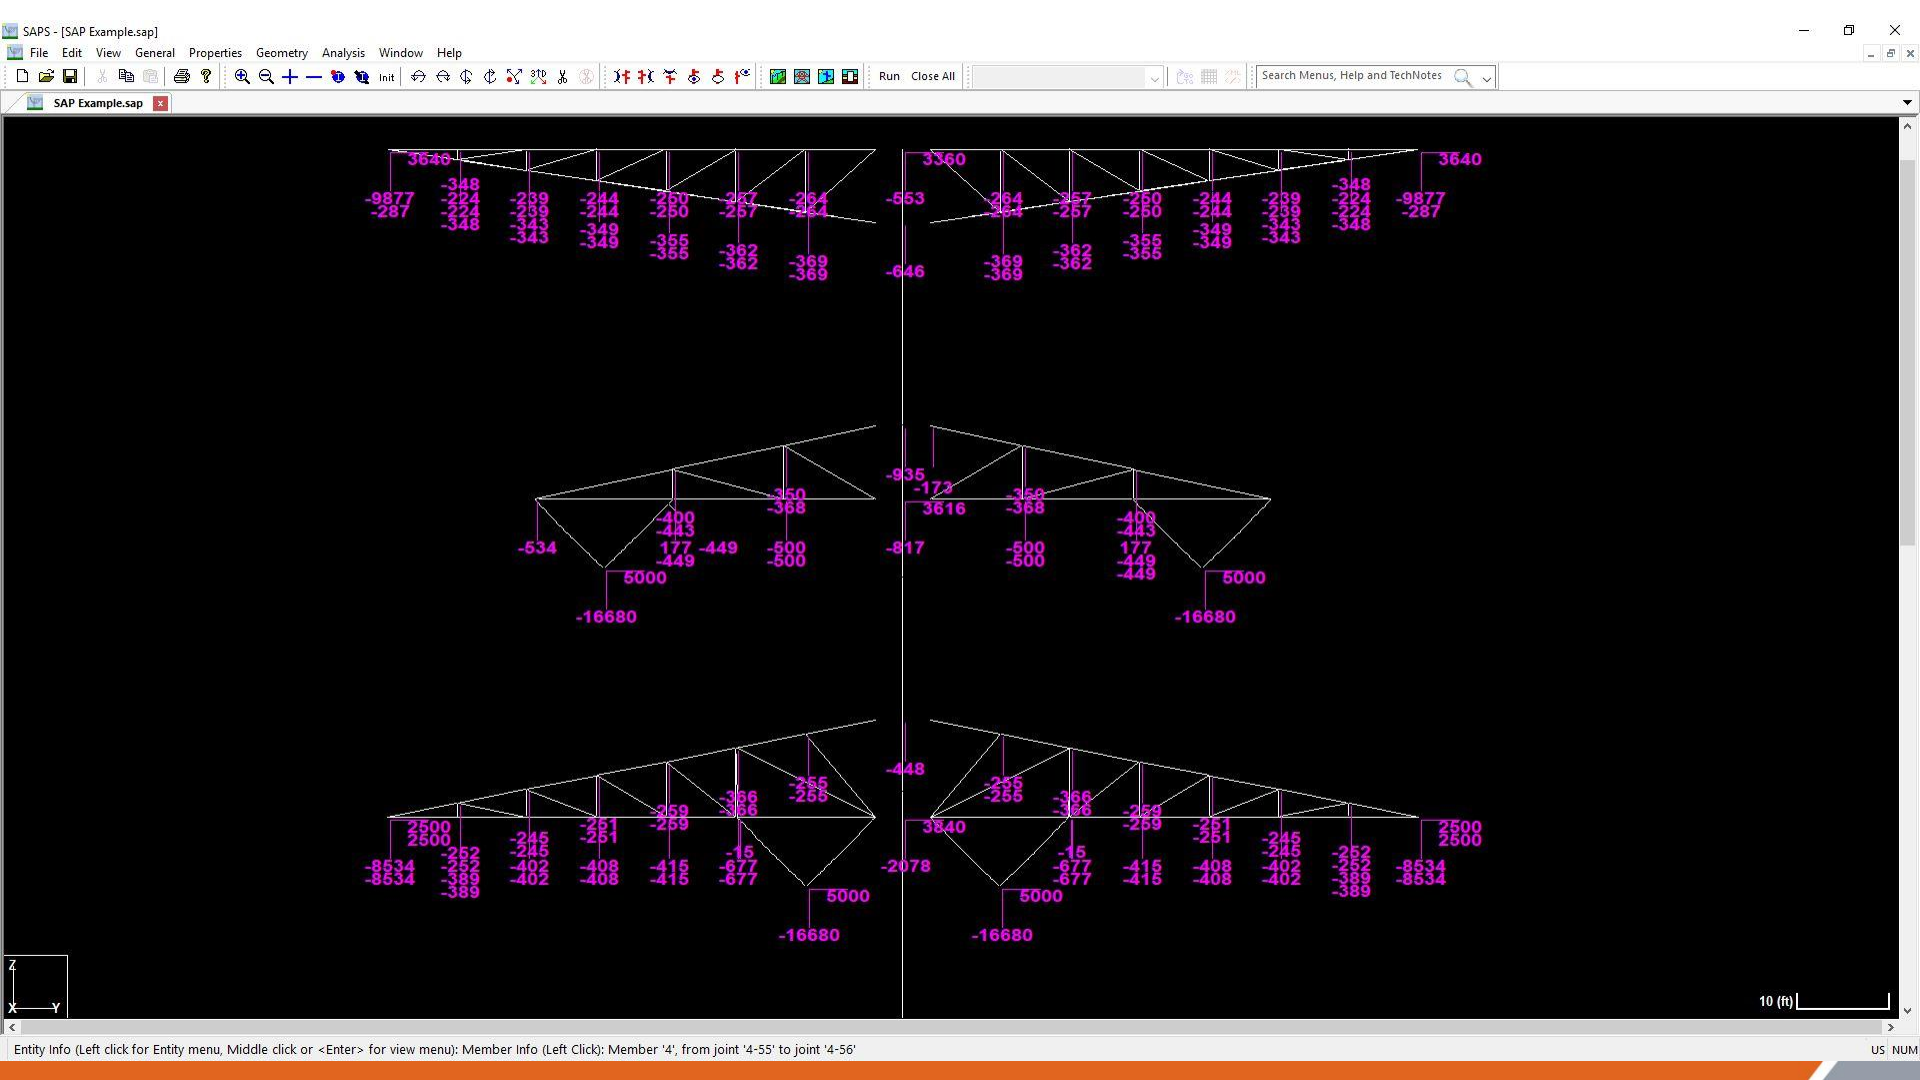

# Merging Files

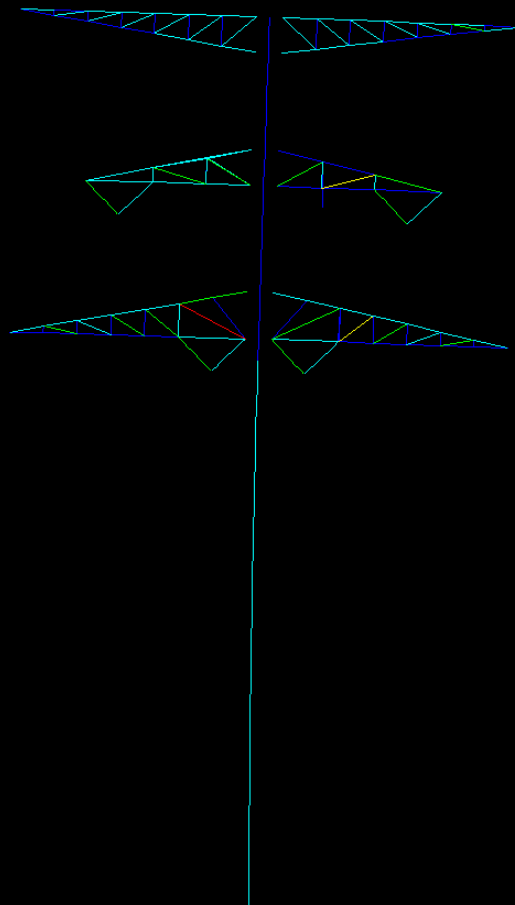

---

- Output SAPS v1 file for both models
- Open each file with SAPS
  - Save library files and SAPS (.sap) file
- Copy and paste to combine models
  - Copy model with fewer elements (usually pole elements)
  - Merge Libraries
  - Joints
  - Members
  - Loads\*
- Joint Ties and Constraints

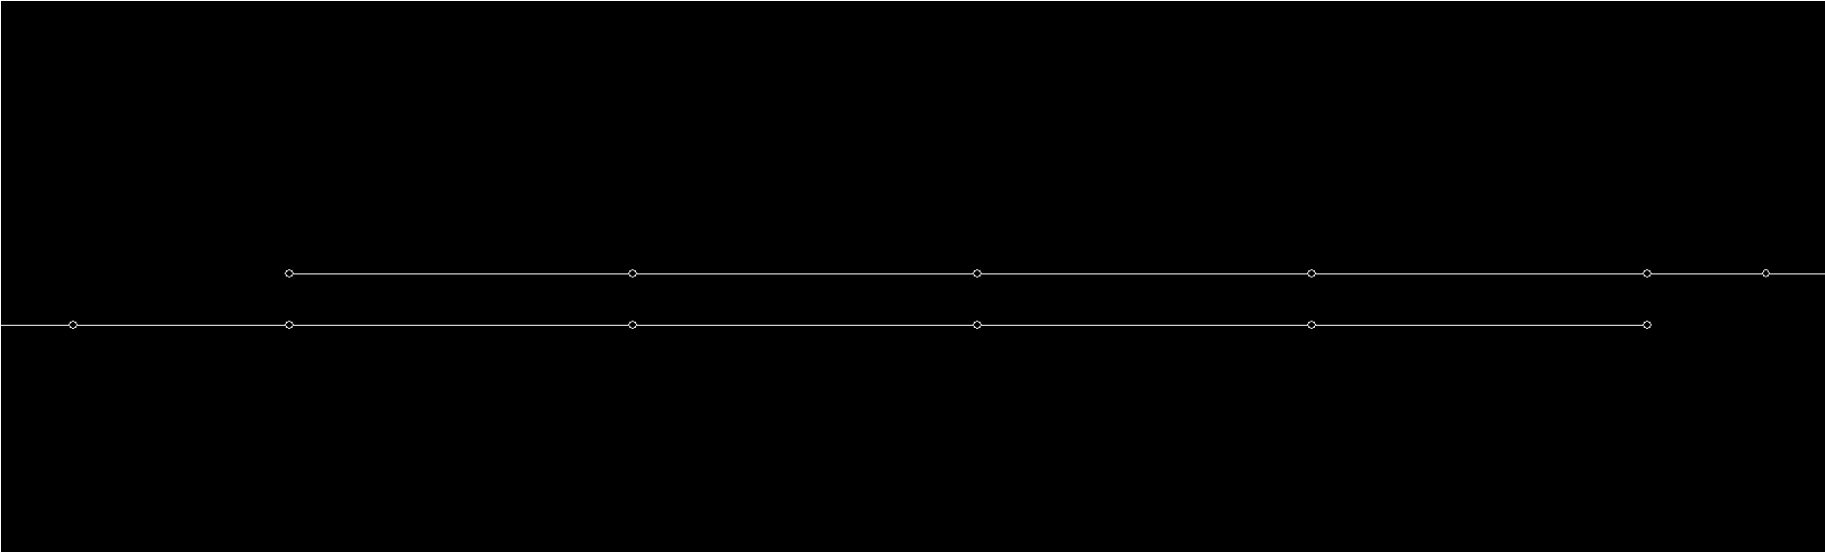

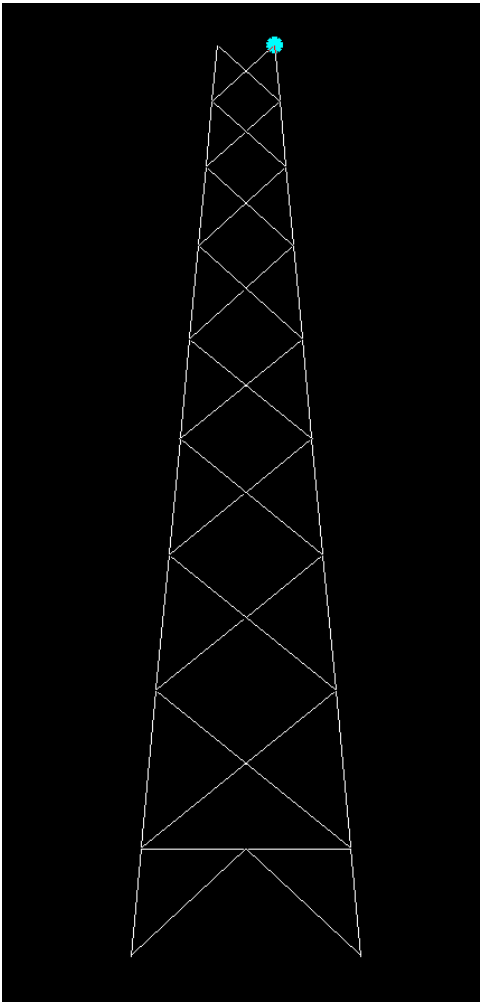

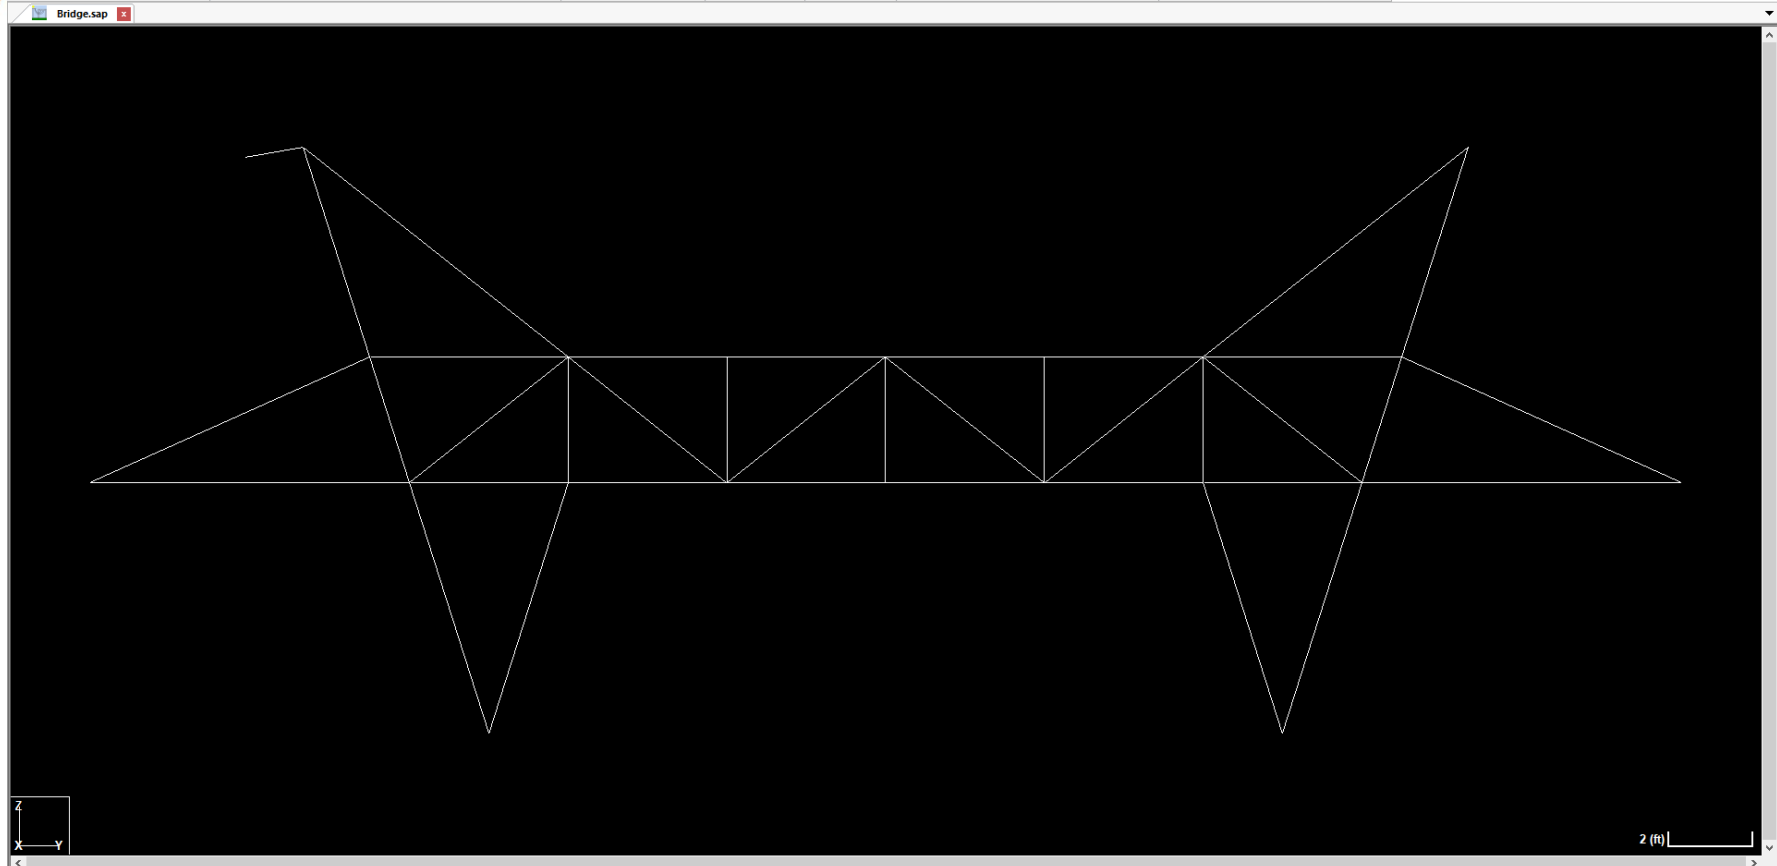

# OTHER SAPS EXAMPLES

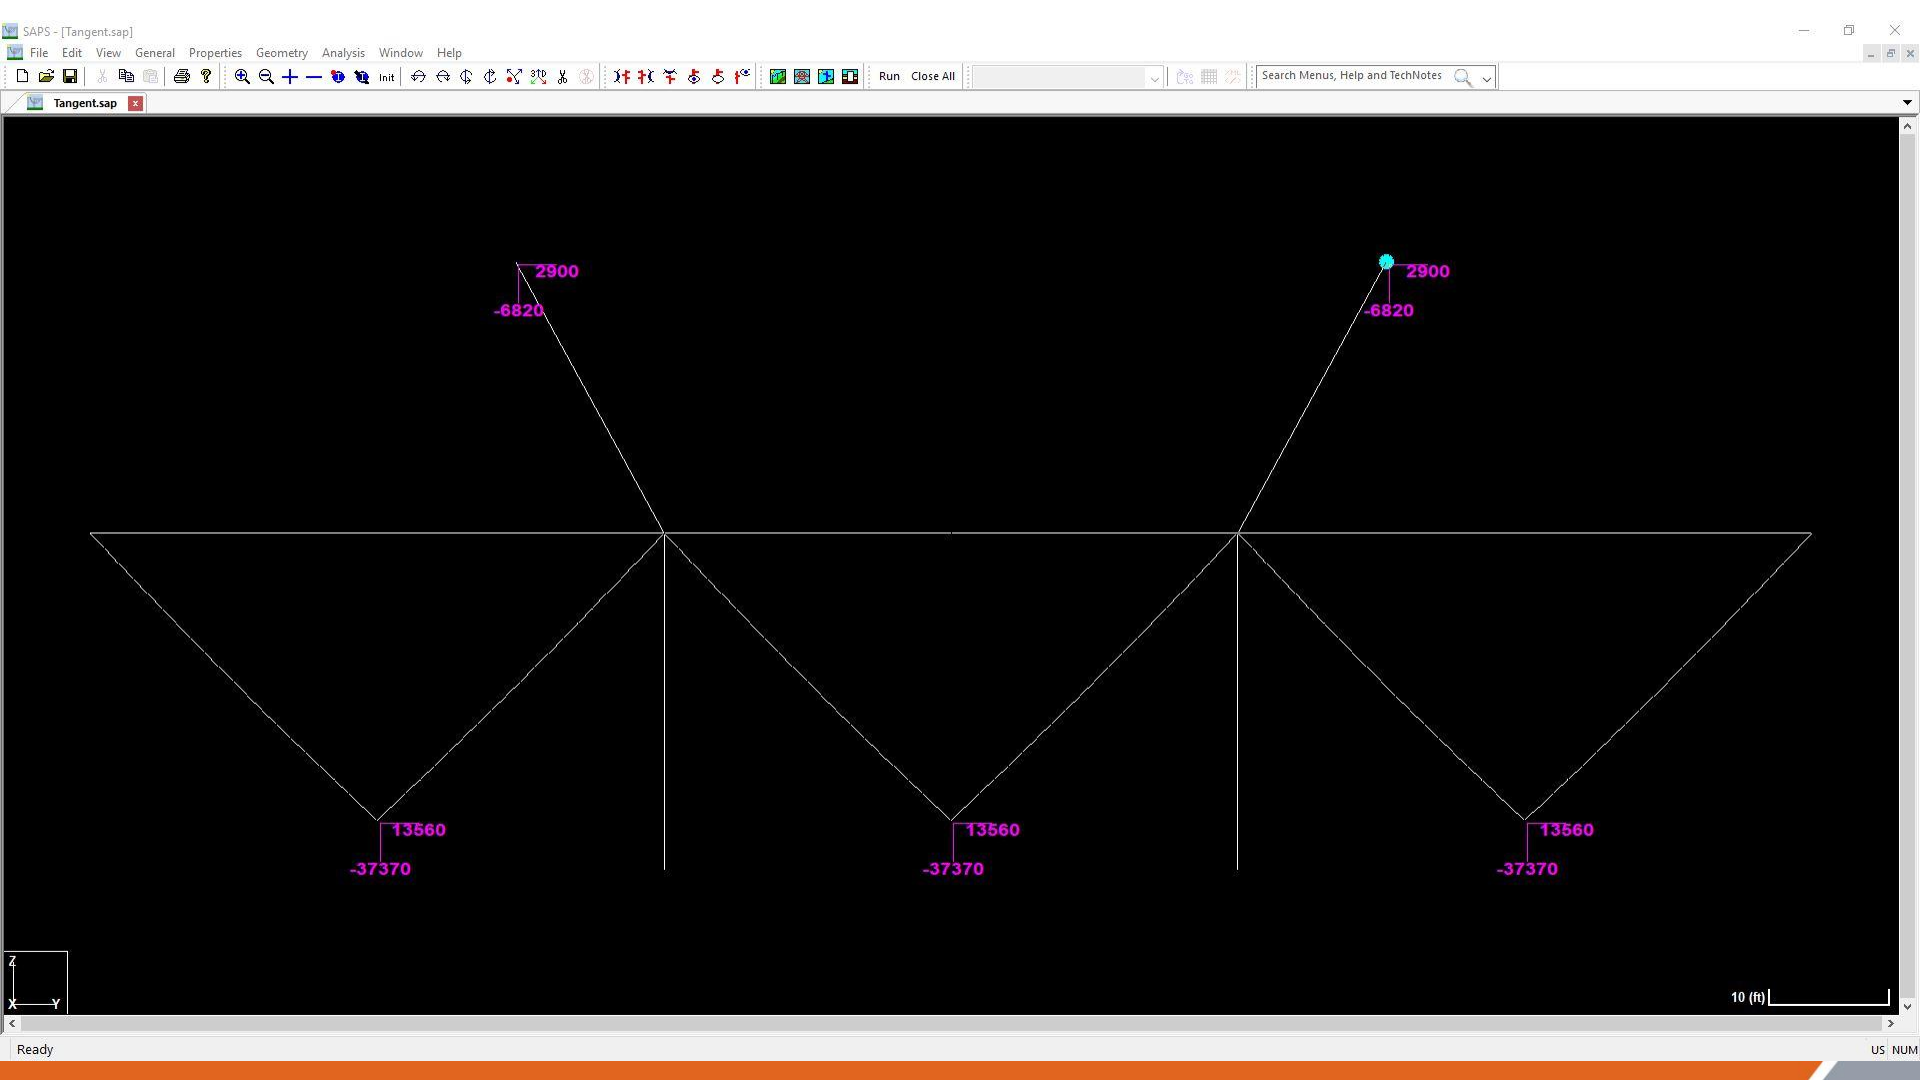

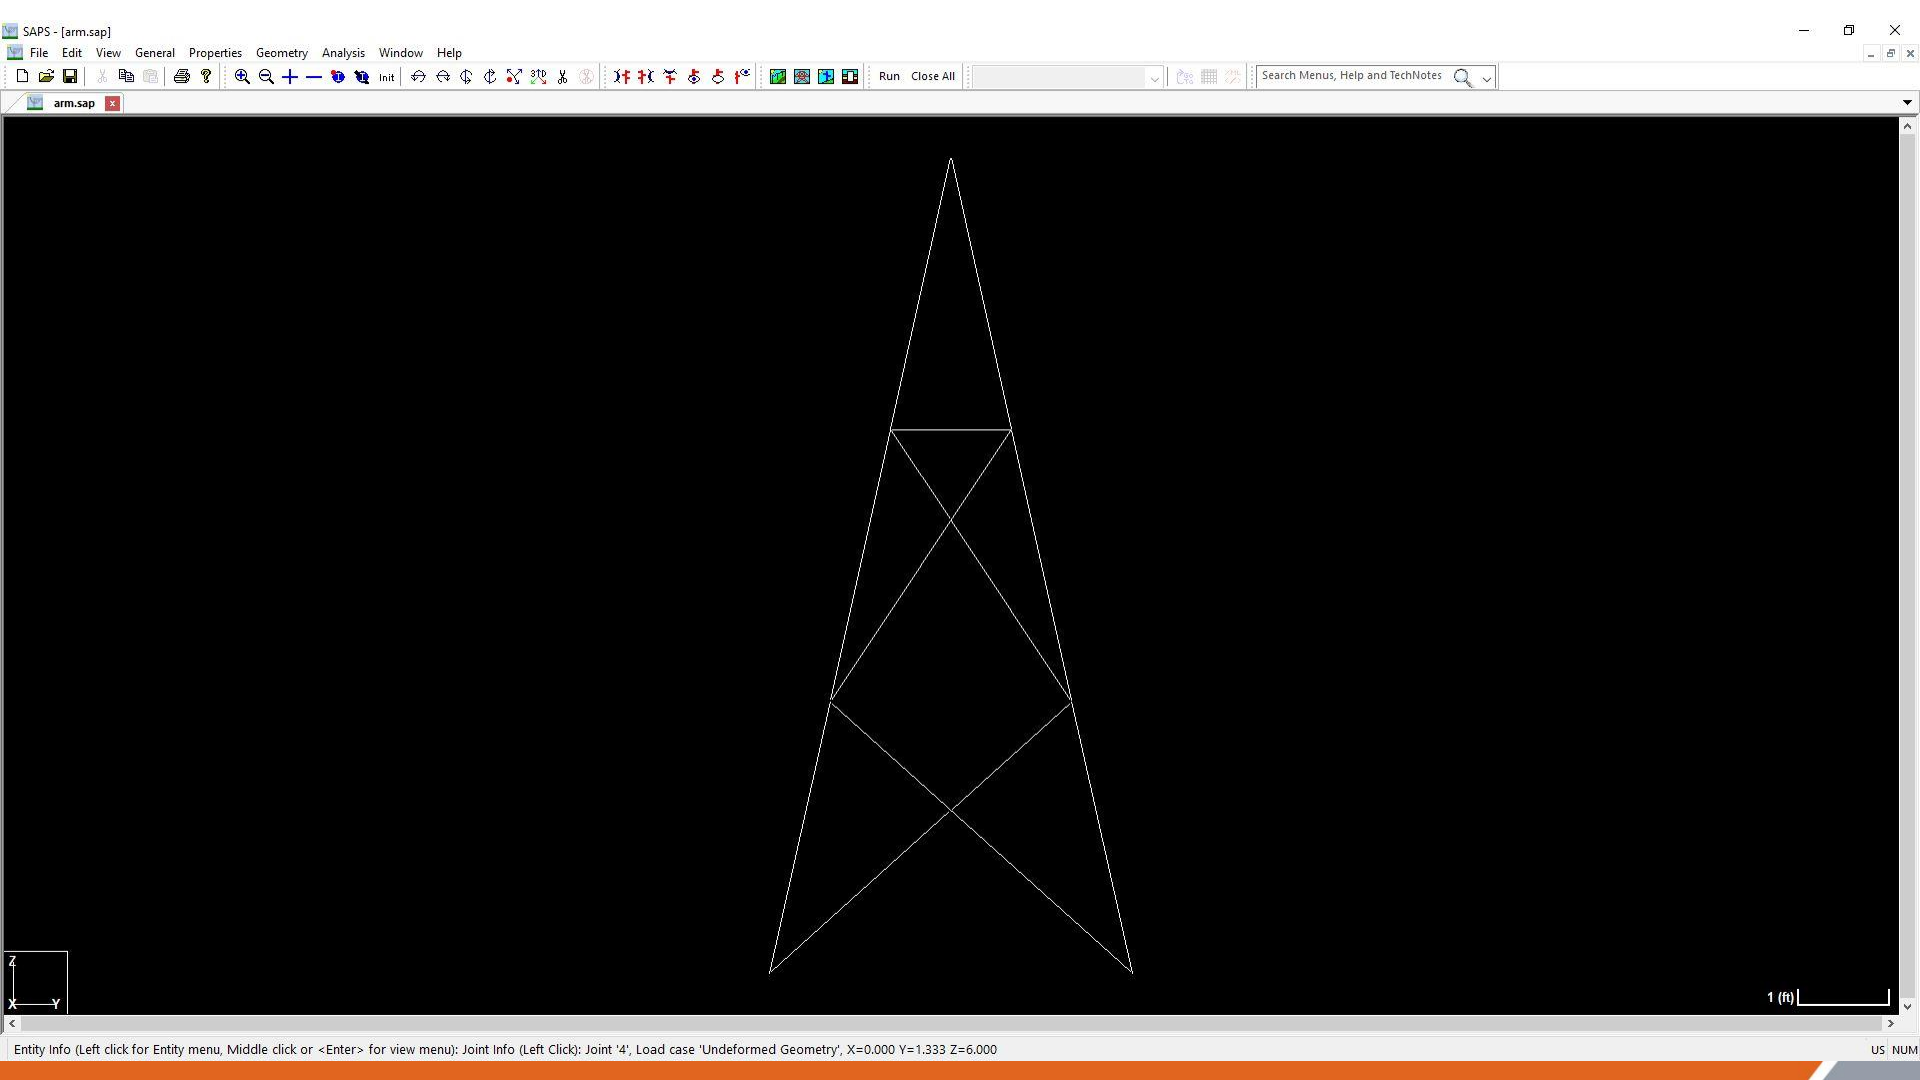

Entity Info (Left click for Entity menu, Middle click or <Enter> for view menu): Joint Info (Left Click): Joint '2', Load case 'Undeformed Geometry', X=0.000 Y=-13.904 Z=14.000

# Concluding Questions

---

- Can ASCE 48 and ASCE 10 be combined where it makes sense?
  - Add clarifications for applicability to combined frame structures in the Commentaries
- Or, do we need a Transmission Frame Standard?

**THANK YOU!**
